

Empower™ for Hydrogen Blending Solutions

Digital connectivity with expert support

Spartan's EMPOWER™ Solution

CHALLENGE

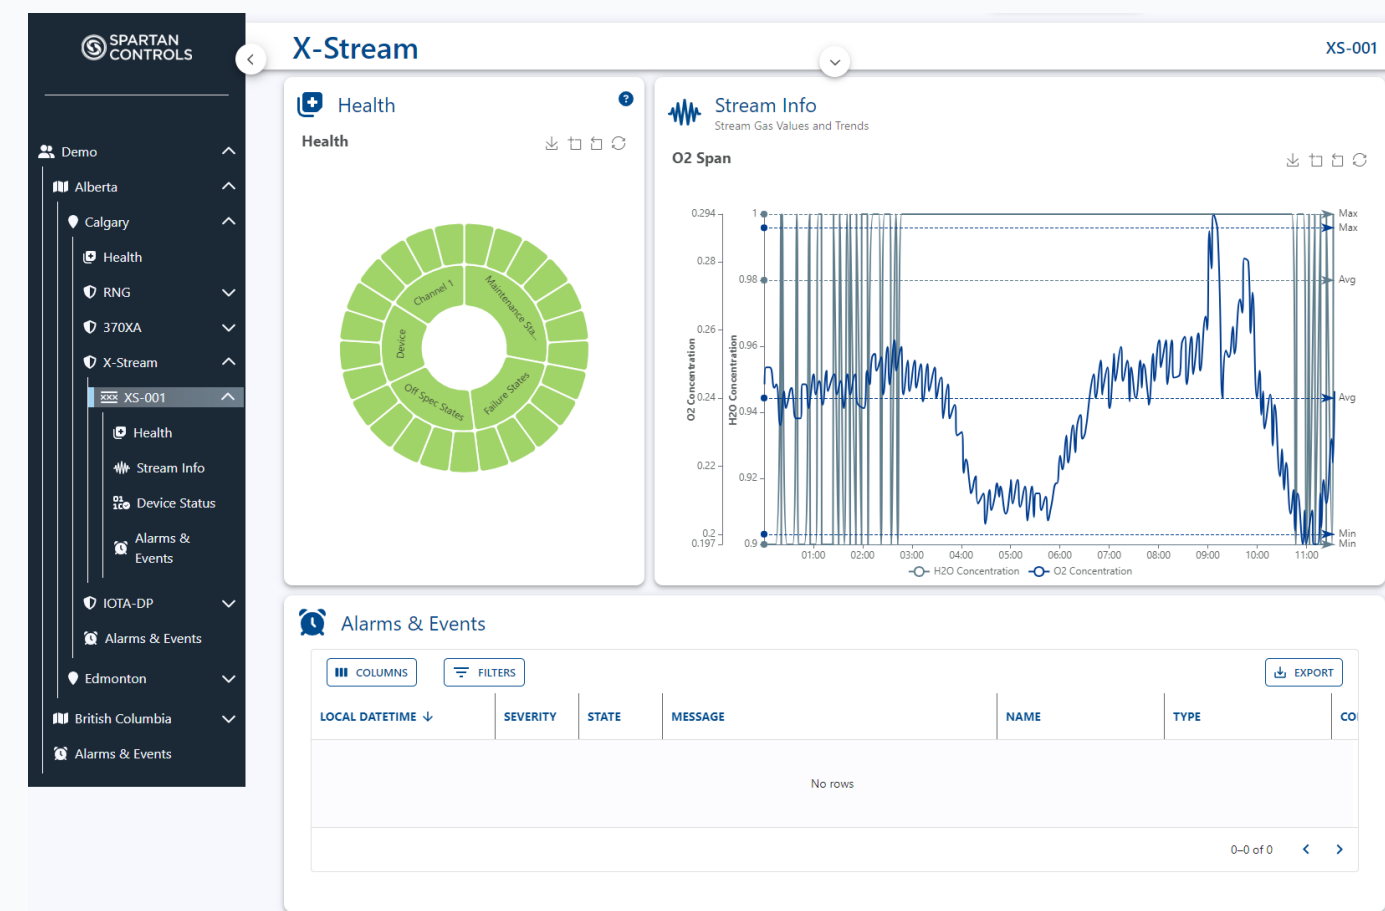

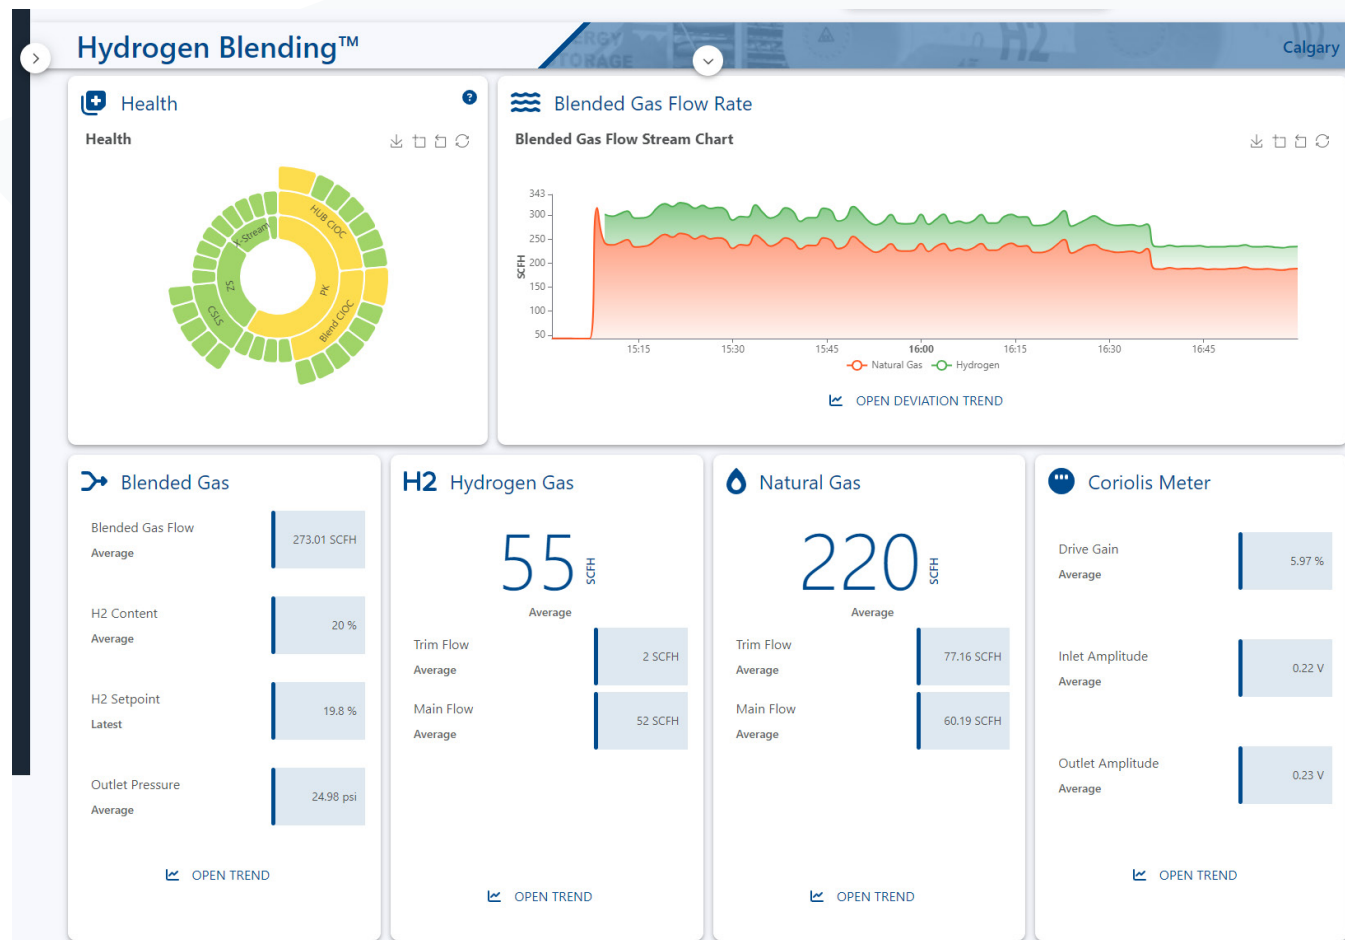

As natural gas distribution companies work towards decarbonizing their operations, hydrogen blending is emerging as an important new application. Blending hydrogen reliably and accurately into existing natural gas pathways will require a large number of new assets – each of which will contain precision hydrogen analyzers and other specialized control equipment. While traditional approaches for supporting large fleets of assets required on-premise expertise, new advances in communications technology and network connectivity to previously isolated regions make it possible to access expertise from anywhere.

SOLUTION

Spartan's Empower solution for Hydrogen Blending provides you with remote support and access to our expert service team. Our team will monitor your system for reliability and maintenance issues, enabling you to address potential problems before they cause operational issues. Our OEM expertise in each of the solution components offers your team with additional support for this challenging application, allowing your team to focus on operating the system and executing required maintenance.

EMPOWER 200™ Preventative Maintenance, Monitoring, Analysis, and Support

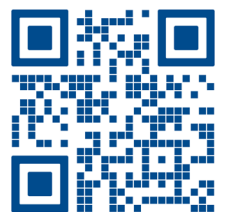

- Ongoing system monitoring for equipment health issues, leverage equipment diagnostic data
- Quarterly system health and performance report and recommendations
- Globally accessible system dashboard
- Access to Spartan remote service for troubleshooting
